

Capacity Optimization as a Service

Align IT resources with service demands and business priorities

For IT to meet its goal to help the business succeed, it must maintain optimal performance and availability for current and future services.

To accomplish this task, IT resources must be aligned with service demand to deliver optimized cost savings, reduced risk, and improved visibility into utilization trends and their impact on the systems that power them. Capacity management can be a complex process that requires personnel skilled in the discipline and with a good understanding of the business and technology.

Fusion's Capacity Optimization as a Service (COaaS) has been specifically designed with the needs of the capacity manager and business service owners in mind.

Key Service Features

- Experts in capacity planning and skilled in the technology work as part of your team to help you deliver results
- Solve performance problems and assess future capacity needs without having to manage the underlying technology
- Immediately scale your capacity management implementation to cover your whole environment with best practices
- Subscription-based pricing and Cloud-hosted delivery to lower TCO

Our Approach

The Capacity Optimization as a Service offering provides a dependable, low-risk option for capacity management that gives you the flexibility you require so you can focus on the results, not the technology. The service is available in two options:

Cloud-Hosted

Configuration and usage data from your selected assets is collected and securely sent daily to BMC Helix or Fusion's secure cloud-hosted capacity for a minimal deployment footprint on your premises.

On-Premise

The software and the collected data remain in your environment. Our consultants augment your current staff with the expertise to implement, administer, and maintain the software capabilities you need.

Key Benefit

- Provide visibility into how your current infrastructure is being used and where you are over and under provisioned
- Mitigate risks by avoiding not having enough capacity or not having it in time
- Reduce costs by identifying opportunities to reclaim underutilized assets and right-size capacity, optimize changes, and perform cost-driven optimization
- Obtain a comprehensive capacity management solution and practice in record time
- Eliminate the investment and risk associated with hiring, training, and retaining in-house staff to specialize in capacity management
- Achieve results faster by eliminating many of the issues related to start-up time
- Increase platform stability and availability through proactive maintenance and achieve greater productivity and staff satisfaction
- Free yourself and your staff to focus on more strategic work, instead of managing your software
- Control implementation costs with a subscription pricing model and our cloud-hosted delivery model
